

Logged on user has permissions to use self-service

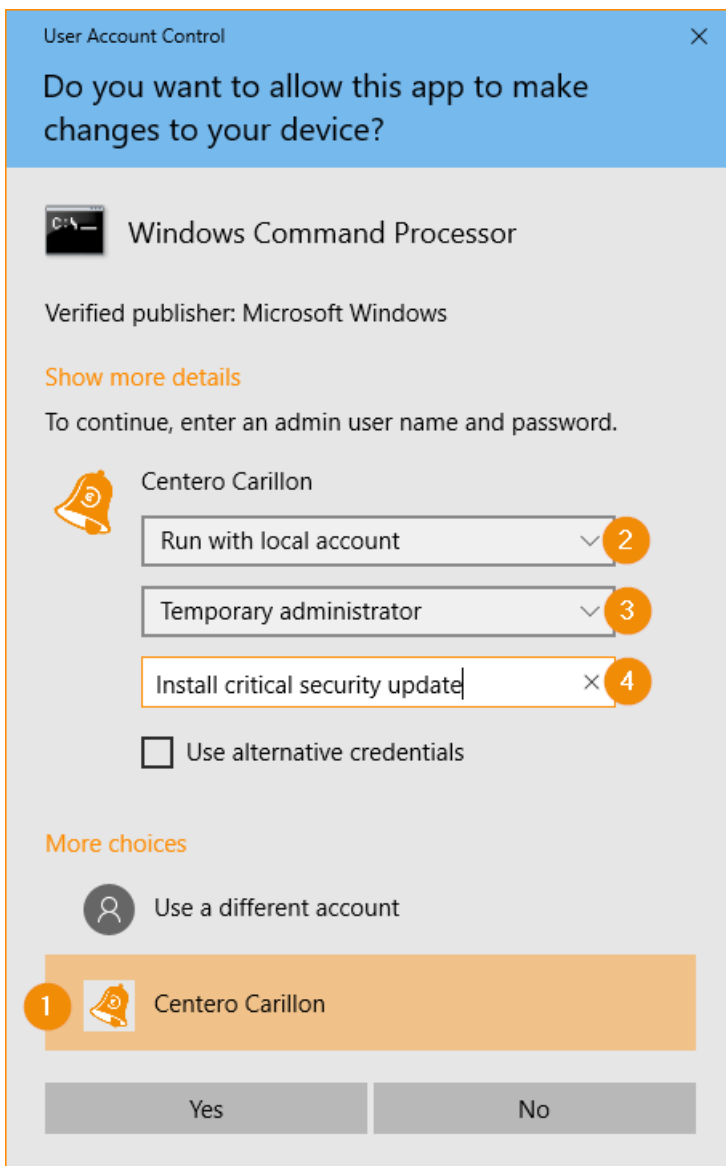

Last Modified on 25/02/2021 2:16 pm EET

Starting from Centro Carillon client version 3.0.5000 the whole temporary user account activation process can be done directly from credential provider. Carillon administrator can limit self-service on for specific users (like service desk personnel) and then user activating temporary user account must specify also own domain account credentials to use self-service.

When action requiring administrator level permissions is executed or user selects **Run as different user** to execute action Windows by default shows User Account Control window where credentials are provided to execute the action. This User Account Control has Centro Carillon option when Carillon credential provider has been installed to client.

1. Click More choices to show Centro Carillon credential provider

1. Click **Centro Carillon** to select Centro Carillon credential provider
2. Select **Run with local account** from dropdown list
3. If more than one temporary user account is available then select desired temporary account from dropdown list
4. Specify the reason why temporary account is required
5. Click **Yes** button to execute action with temporary user account
