Portal administration

Centero Carillon Portal is Microsoft ASP.Net application that is used to configure Centero Carillon database and read reports from database. Access to Centero Carillon Portal is restricted by default using local Windows operating system groups on the server where Centero Carillon Portal is installed. This default authentication and authorization can be changed by modifying IIS authentication settings in IIS manager or by modifying directly the web.config file for Centero Carillon Portal web site.

Default authentication method for Centero Carillon Portal is Windows Integrated authentication.

Default roles

Authorization uses four different local Windows OS groups that can be found and modified for example using 'Computer Management' management console on Windows Operating System.

Centero Carillon Administrators

Users that are members (direct or indirect) of this group will have full access to Centero Carillon Portal

Centero Carillon Configuration Editors

Users that are members (direct or indirect of this group have access to create any configuration, read reports and access Service Desk features on Centero Carillon Portal. Carillon Configuration Editors can't change licensing or modify Active Directories linked to Carillon environment.

Centero Carillon ServiceDesk

Users that are members (direct or indirect) of this group have access to all features in ServiceDesk section and also access to reports.

Centero Carillon Report Readers

Users that are members (direct or indirect) of this group have access to reporting.
