

# Create managed user rule

Last Modified on 22/09/2020 12:06 pm EEST

Creating new managed group rule allows you to add a specified member to selected local group on selected target.

## 1. Select local user

Select local user account that you want to manage. Local user accounts must be first created before management rules can be defined for the local user (see more information from [Create local user](#) chapter).

## 2. Select account type

Select user type for this rule. **Generate temporary user account** that can be activated will create local user account as Centro Carillon temporary user account. **Generate random password and save to database** will create unique random password to local user account and saves password information to Centro Carillon database where specified user can retrieve the passwords. **Use fixed password** will reset local user account password to one specified on rule.

## 3. Fixed password

Specify desired password to be set for local user account on target computer(s). Password will be shown on screen! This field is available only if **Use fixed password** is selected.

## 4. Validity time

Select if you want managed user rule to be valid only for a specified time. Also specify validity time.

Maximum validity time is specified by Centro Carillon Administrator.

This field is available only if enabled by Centro Carillon administrator. See more information in **Centro Carillon Administration Guide**.

5. Select rule status

Select if managed user group rule is enabled or disabled. When rule is enabled it will be applied to target computer(s).

6. Add managed user rule

Add new managed user rule. If managed user rule was created the window will be automatically closed.

7. Cancel

Cancel managed user rule creation and close the window.
