

Move from trial to production

Last Modified on 18/02/2021 3:38 pm EET

If you have piloted Centro Carillon first and you want to end pilot and move to production, then you need to do few tasks. Licenses need to be updated, management rules and client deployment need to be verified.

1. Licenses

The screenshot shows the Centro Carillon management portal. The top navigation bar includes 'Frontpage', 'Configuration', 'Reporting', 'ServiceDesk', and 'Settings'. The 'Settings' menu is open, showing 'Licenses' (1), 'Active Directories', and 'Change database'. On the left, the 'Licenses' sidebar is expanded to 'Carillon server license', showing details for 'Customer name: Centro Oy', 'Version: 1.8.5000', 'Expires: Never', and 'Support expires: Never'. At the bottom of the sidebar is a 'Load server license' button (2) and an 'Active Directories' dropdown. The main content area is titled 'Client Access Licenses' and contains a toolbar with a 'Show button text' button and a 'Licenses' icon (3). Below the toolbar is a table with columns: License ID, Upgrade ID, Version, Amount, Expires (UTC), and Support expires (UTC). The table contains one row with License ID 637492510130988342, Version 1.8.5000, and Amount 200. The table footer shows 'Page: 1 of 1', 'Page size: 1', and 'Item 1 to 1 of 1'.

Request new licenses from Centro and specify the amount of required CAL licenses. When you have received the licenses, open your Carillon management portal:

1. Open **Settings \ Licenses** page
2. Click **Load server license** button and follow [these](#) instructions to load server license file (file name has 'Database' in the middle)
3. Click load client access license image on the toolbar (**first icon**) and follow [these](#) instructions to load CAL license file (file name has 'CAL' in the middle)

2. Management rules

If you have targeted your management rules to pilot devices only, then move (create new and remove old) pilot rules to locations that affect all desired devices. As a best practice, you should use domain and OU management rules for on-premises AD devices, group rules for Azure AD devices and category rules for WORKGROUP devices.

3. Client deployment

If you are using automated deployment of Carillon clients, verify that client deployment will be changed so that it targets all required devices.
