Server components installation

Last Modified on 25/02/2021 1:39 pm EET

Extract installation media to local folder on server. If you are installing all Carillon server components to single server, then execute 'Installation Media\Server\Install.cmd' with administrative permissions. This installation script will start required server component installations. You can also install components manually one-by-one (use this method if you want to split server components to several servers) in following order:

1. Centero Carillon management portal

   This installation will also create Carillon database to the SQL server specified during the installation

2. Centero Agent Gateway

3. Centero Agent

   Required if Centero Agent Gateway is installed to the server

4. Centero Carillon Client

   Required if Centero Agent Gateway is installed to the server

> **Note!**
>
> Centero Agent and Centero Carillon Client are needed on Centero Agent Gateway for automated Carillon client cleanup and random password regeneration
